

Continuous Difference-in-Differences (DiD) Results

Model Specification: $Y_{it} = \alpha_i + \delta_t + \beta(\text{Post}_t \times \text{Exposure}_i) + \gamma_j + \epsilon_{it}$

Absorbing LS Estimation Summary						
Dep. Variable:		bias_score	R-squared:		0.0792	
Estimator:		Absorbing LS	Adj. R-squared:		0.0779	
No. Observations:		695721	F-statistic:		184.06	
Date:		Mon, Apr 27 2026	P-value (F-stat):		0.0000	
Time:		01:52:58	Distribution:		chi2(1)	
Cov. Estimator:		robust	R-squared (No Effects):		0.0003	
			Variables Absorbed:		995.00	
Parameter Estimates						
	Parameter	Std. Err.	T-stat	P-value	Lower CI	Upper CI
post_x_exposure	-0.0360	0.0027	-13.567	0.0000	-0.0412	-0.0308

Interpretation:
The 'post_x_exposure' coefficient represents the DiD estimator (β).
A statistically significant coefficient (p-value < 0.05) indicates that the COVID-19 shock had a measurable impact on the media bias score for companies based on their sector exposure, controlling for firm, outlet, and time fixed effects.
