

Continuous Difference-in-Differences (DiD) Results - Stock Returns
=====

Model Specification: $Return_{it} = \alpha_i + \delta_t + \beta(Post_t \times Exposure_i) + \epsilon_{it}$

Absorbing LS Estimation Summary						
=====						
Dep. Variable:	daily_return	R-squared:	0.3756			
Estimator:	Absorbing LS	Adj. R-squared:	0.3493			
No. Observations:	62667	F-statistic:	0.1843			
Date:	Mon, Apr 27 2026	P-value (F-stat):	0.6677			
Time:	01:55:57	Distribution:	chi2(1)			
Cov. Estimator:	robust	R-squared (No Effects):	0.0000			
		Variables Absorbed:	2536.0			
Parameter Estimates						
=====						
	Parameter	Std. Err.	T-stat	P-value	Lower CI	Upper CI

post_x_exposure	0.0001	0.0003	0.4293	0.6677	-0.0005	0.0008
=====						

Interpretation:
The 'post_x_exposure' coefficient represents the DiD estimator (β).
A statistically significant coefficient (p-value < 0.05) indicates that the COVID-19 shock had a measurable impact on firm daily stock returns based on their sector exposure, controlling for firm and daily time fixed effects.
